Why Stress Testing in Oilfield Operations?

- Drilling wellbore stability
- Well casing design perforacion
- Solid production prediction
- Critically-stressed frac analysis
- Cap-rock integrity assessment
 - Enhanced recovery injector wells
 - Cutting re-injection wells
 - Underground gas storage
- Hydraulic fracturing containment
- Reservoir compaction / subsidence

Reduction of
Tectonic Stress
UNCERTAINTY

Accurate field
Prediction &
BETTER ROI

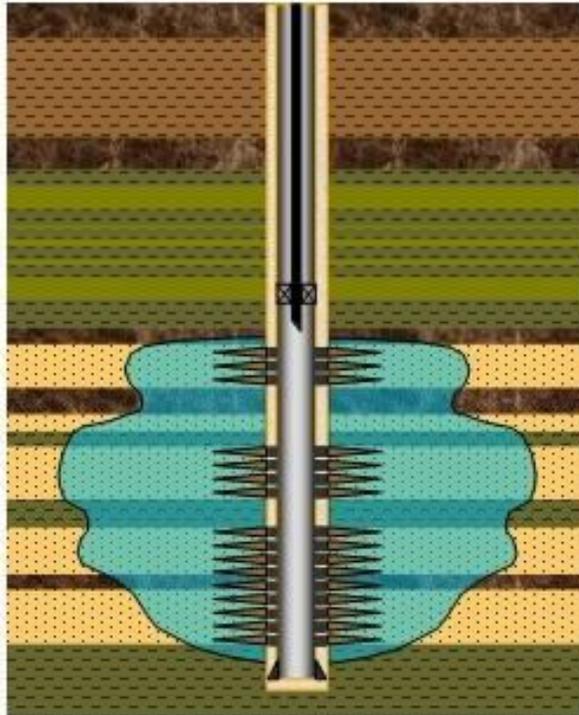

Outline

- What is microfrac stress testing
- Logs don't measure stress
- Bad news – underutilized technology
 - History data, ops. challenges, and track record
- Good news – service improvement
 - Upgraded tool capabilities and enhanced workflow
- Case studies and applications
- Take away message

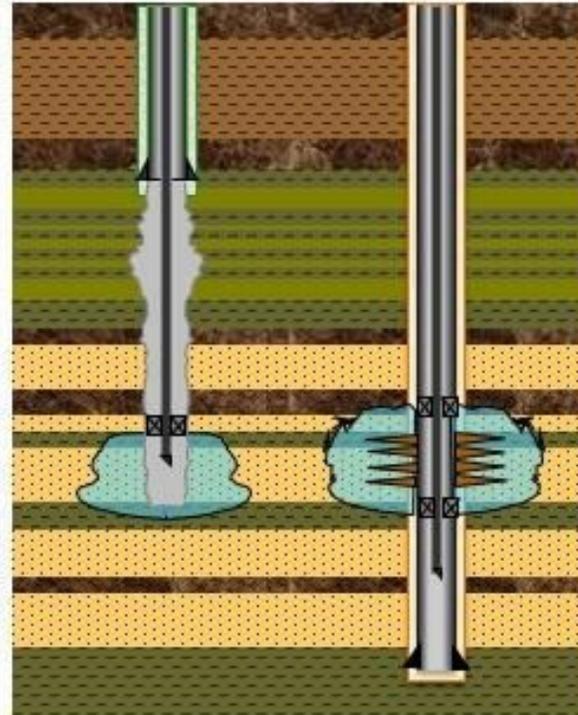

Minifrac / Microfrac Clarifications

Surface Minifrac

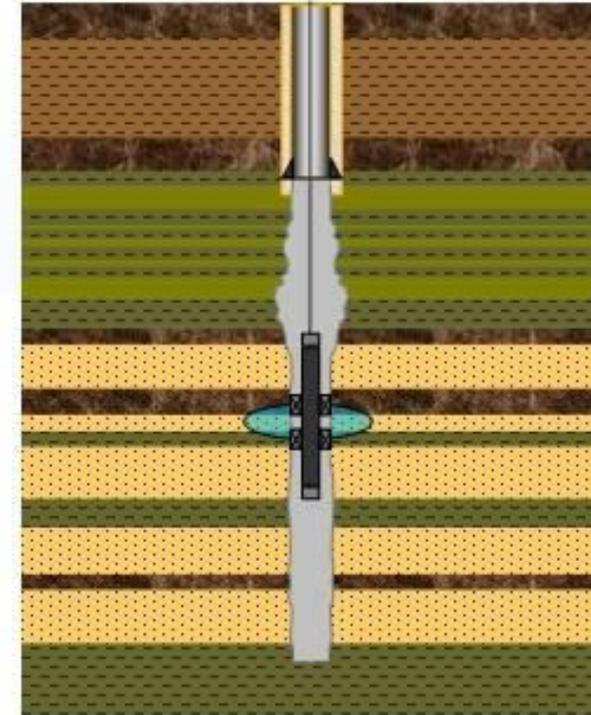

- * Cased-hole / Surface pumping
- * Test interval [20 - 100 ft]
- * Very high rate [2 - 10 bpm]
- * Injection vol. [10 - 100 bbl]

Surface MicroFrac

- * CH or OH / Surface pumping
- * Test interval [10 - 20 ft]
- * High flow rate [5 - 25 gpm]
- * Injection vol. [20 - 200 gal]

Downhole MicroFrac

- * Open-hole / Downhole pumping
- * Test interval [3 - 5 ft]
- * Very low rate [0.1 - 2 lpm]
- * Injection vol. [7 - 30 liters]

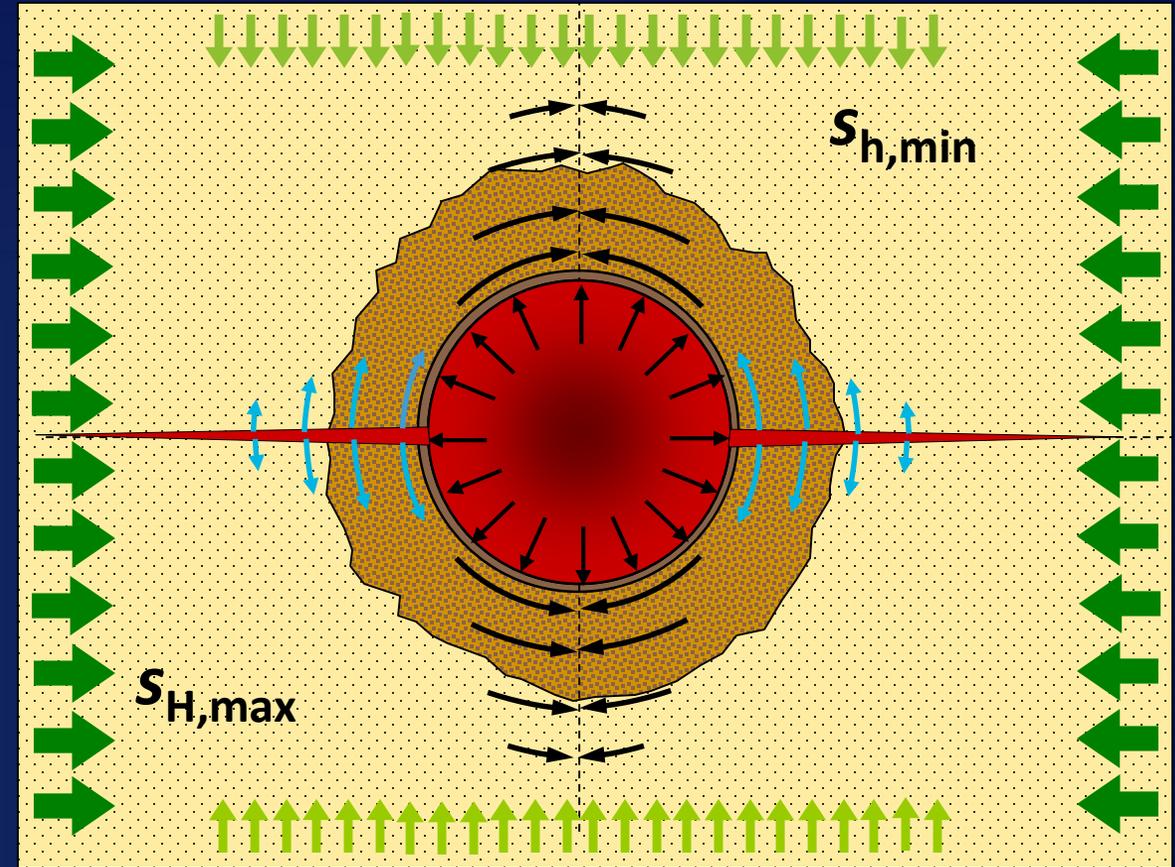

Technology Advantages

- 1) Stress contrast between pay and non-pay zones
 - Multiple testing intervals
- 2) Less poro-elastic effects in reopening and closure
 - Small volume fracture
 - Low injection rate
- 3) Accurate measurements
 - Downhole injection
 - No borehole effects
 - In-situ pressure gauges

Straddle Packer Microfrac Testing

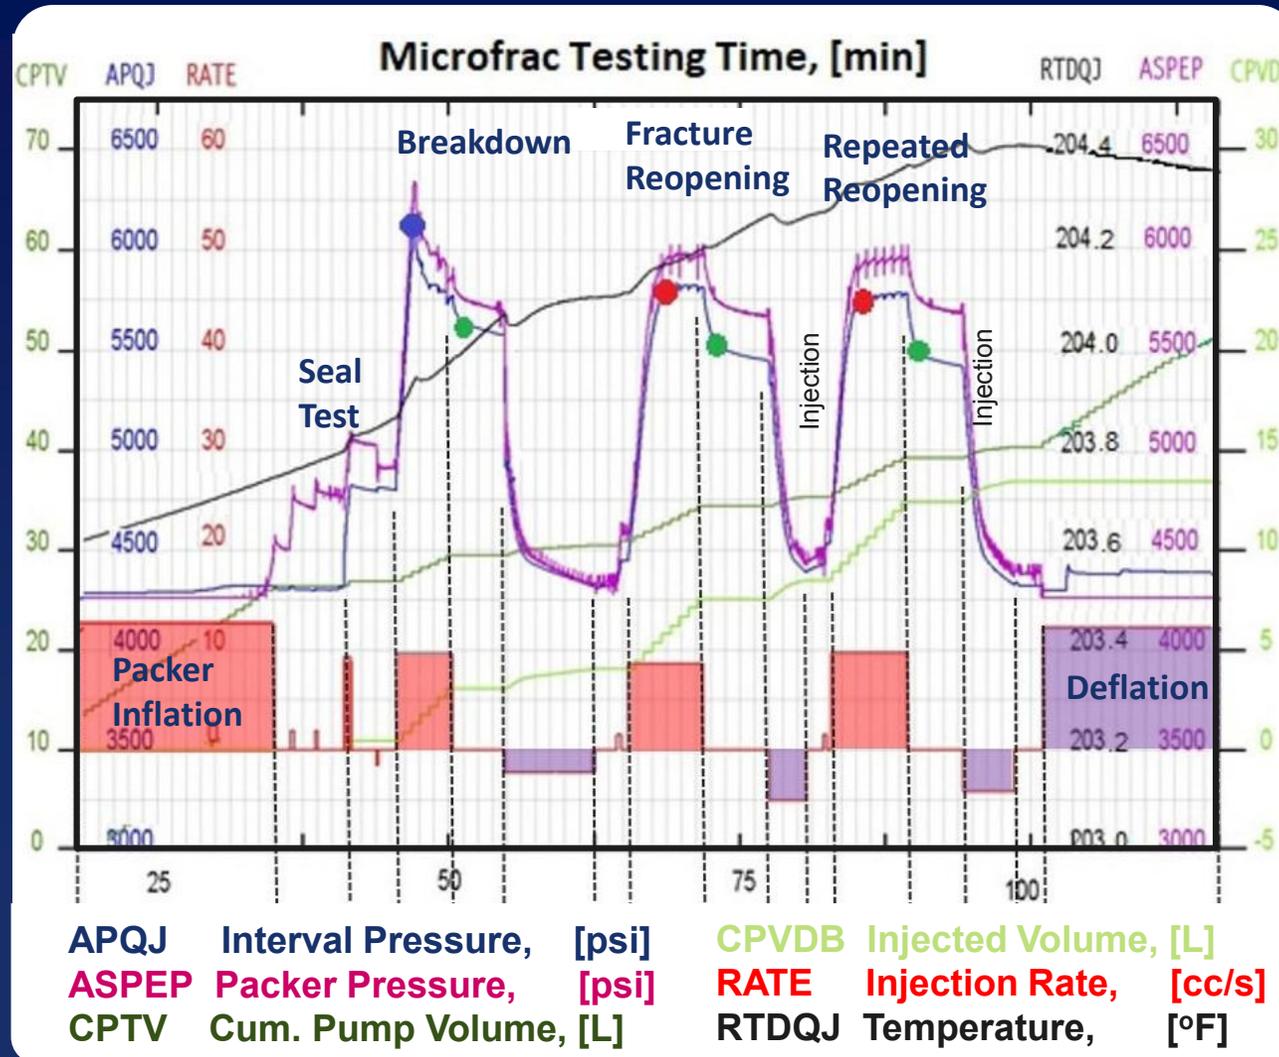

Cross-section

Plane-view

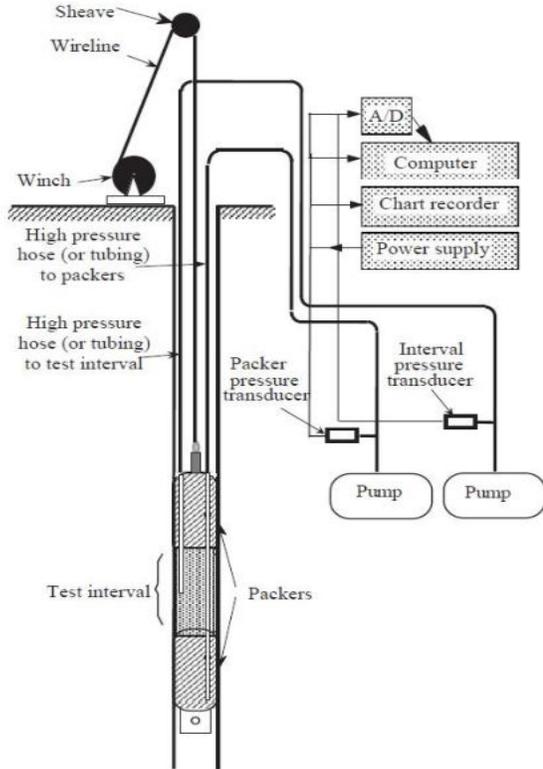

Microfrac Stress Testing Data

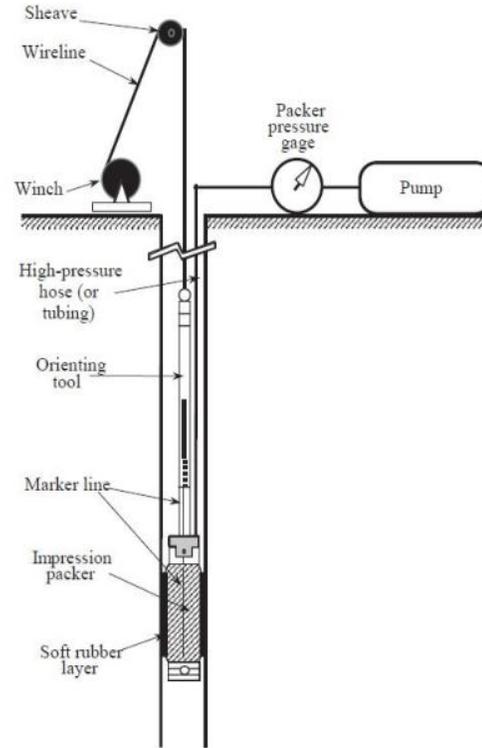

- Formation breakdown pressure
- Fracture Reopening & propagation
- Fracture closure pressure

Dual-Packer Sleeve Frac

Logs Don't Measure Stress

Dual-Packer Microfrac

Single-Packer Microfrac

Logs ONLY measure consequences of stress:

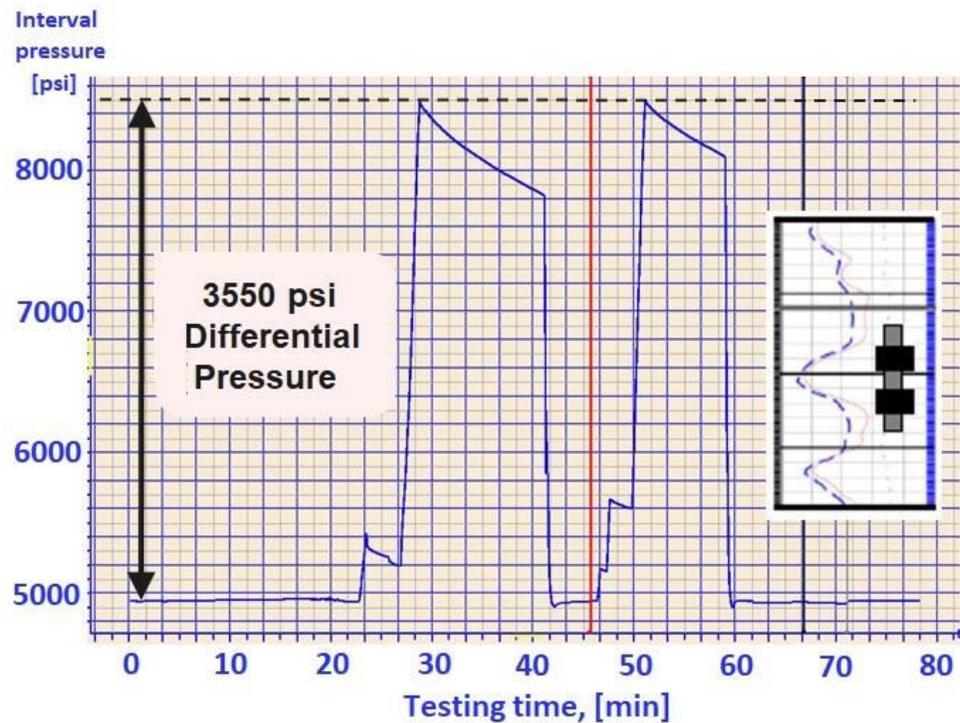

- Changes in porosity, density, slowness, and rock stiffness
- Borehole failure evidences

ONLY Microfrac testing measure stress directly

Haimson and Cornet (2003) ISRM Suggested Methods for Rock Stress Estimation

Microfrac Testing: Underutilized Technology

- Straddle Packer Microfrac Underutilization
 - Insufficient tool capability and packer performance

Microfrac testing unable to achieve formation breakdown

Packer rupture

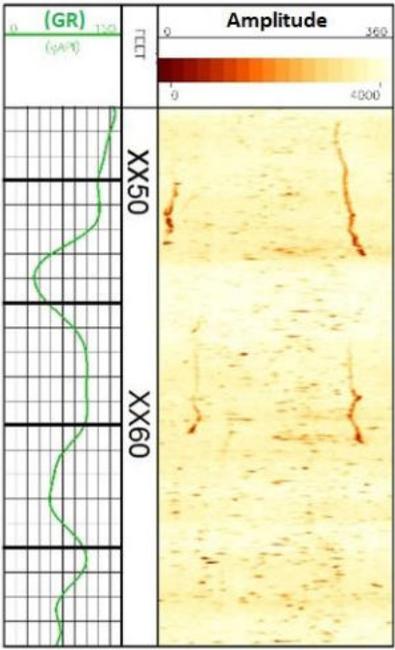

Permanent deformation

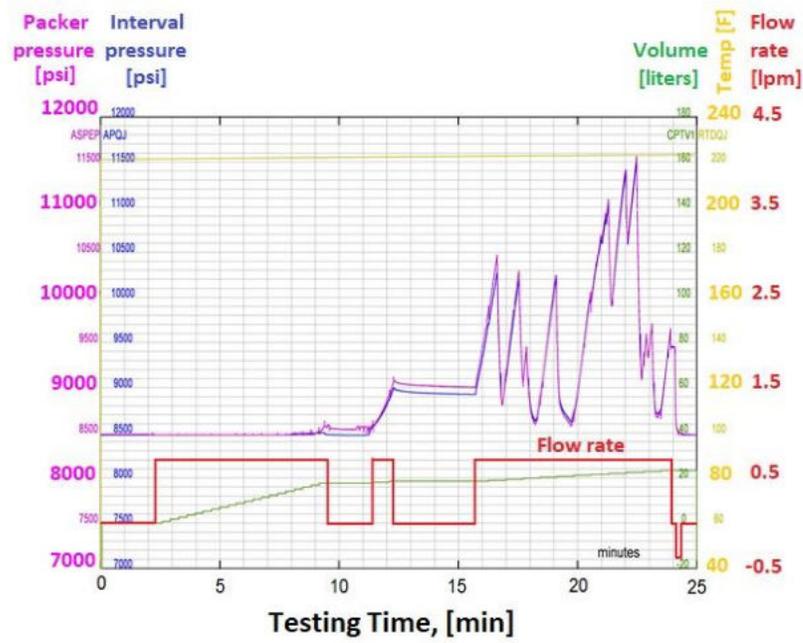

Microfrac Testing: Underutilized Technology

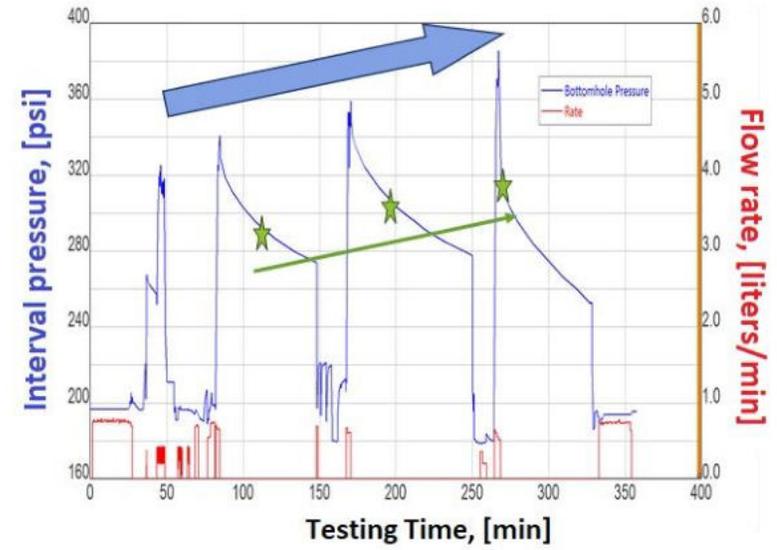

- Straddle Packer Microfrac Underutilization
 - Insufficient tool capability and packer performance
 - Deficient Service Deployment (interval selection)

Unintentional sleeve fracturing

Poor interval isolation and packer sealing

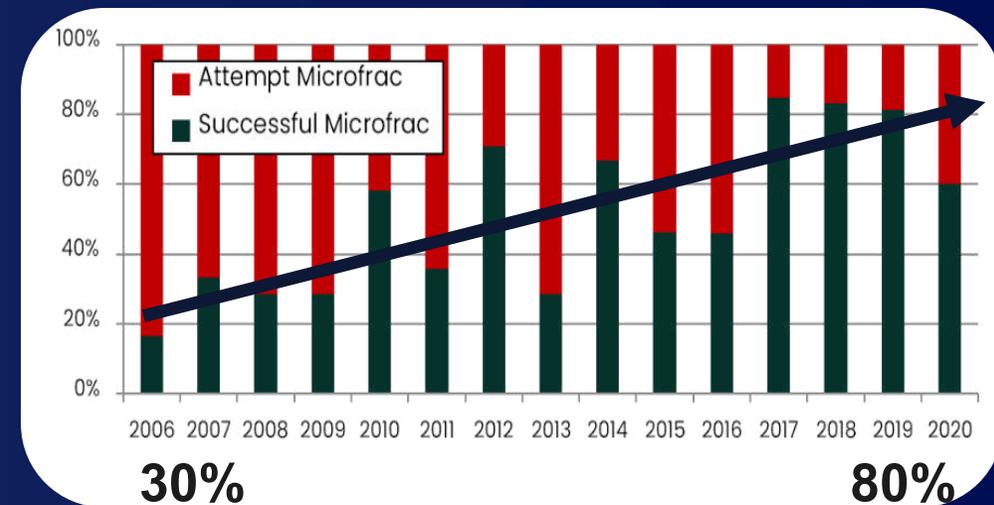

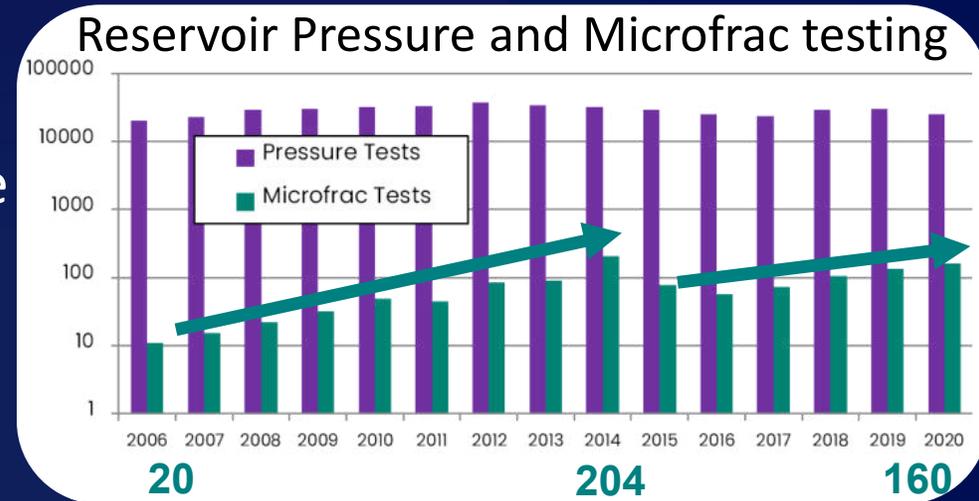

Near wellbore poro-elastic effects

Microfrac Testing: Underutilize Technology

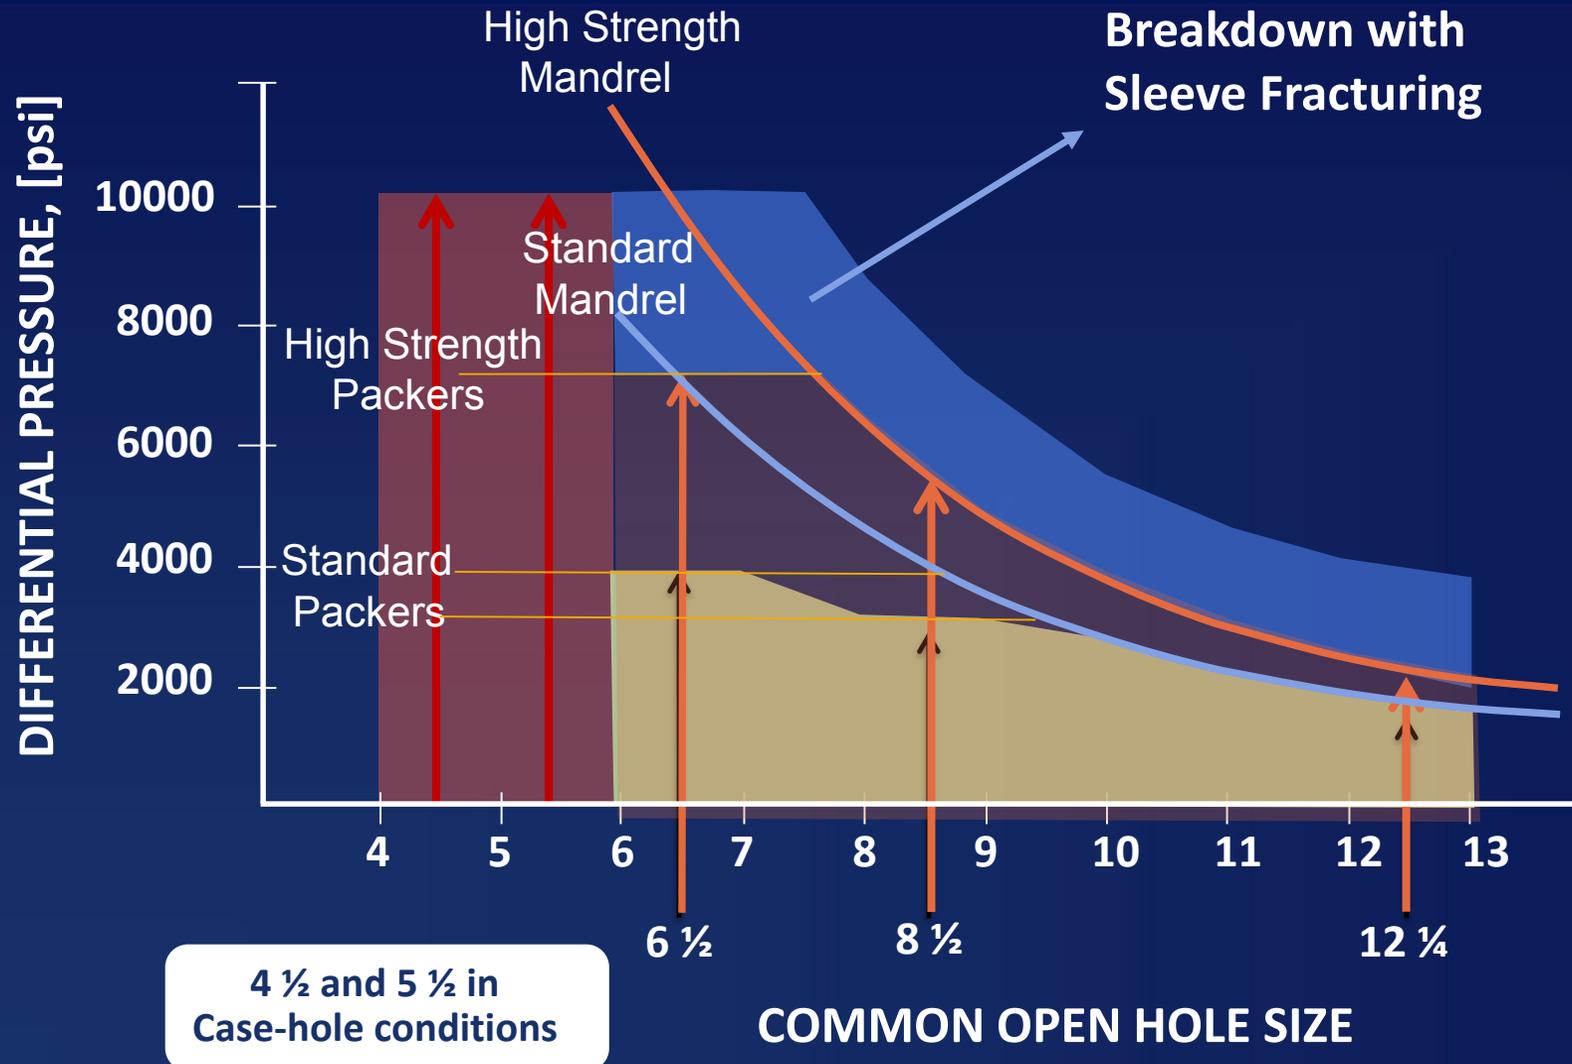

- Straddle Packer Microfrac Underutilization
 - Insufficient tool capability and packer performance
 - Deficient Service Deployment
 - Tool Plugging (high solid content in the mud)
 - Differential sticking (high overbalance)
- Microfrac Performance Improvement
 - Upgraded tool capabilities (Mandrel & Packer)
 - Enhanced microfrac service workflow
 - Improved operational practices

Upgraded Straddle Packer Capabilities

Standard Tool

High Strength

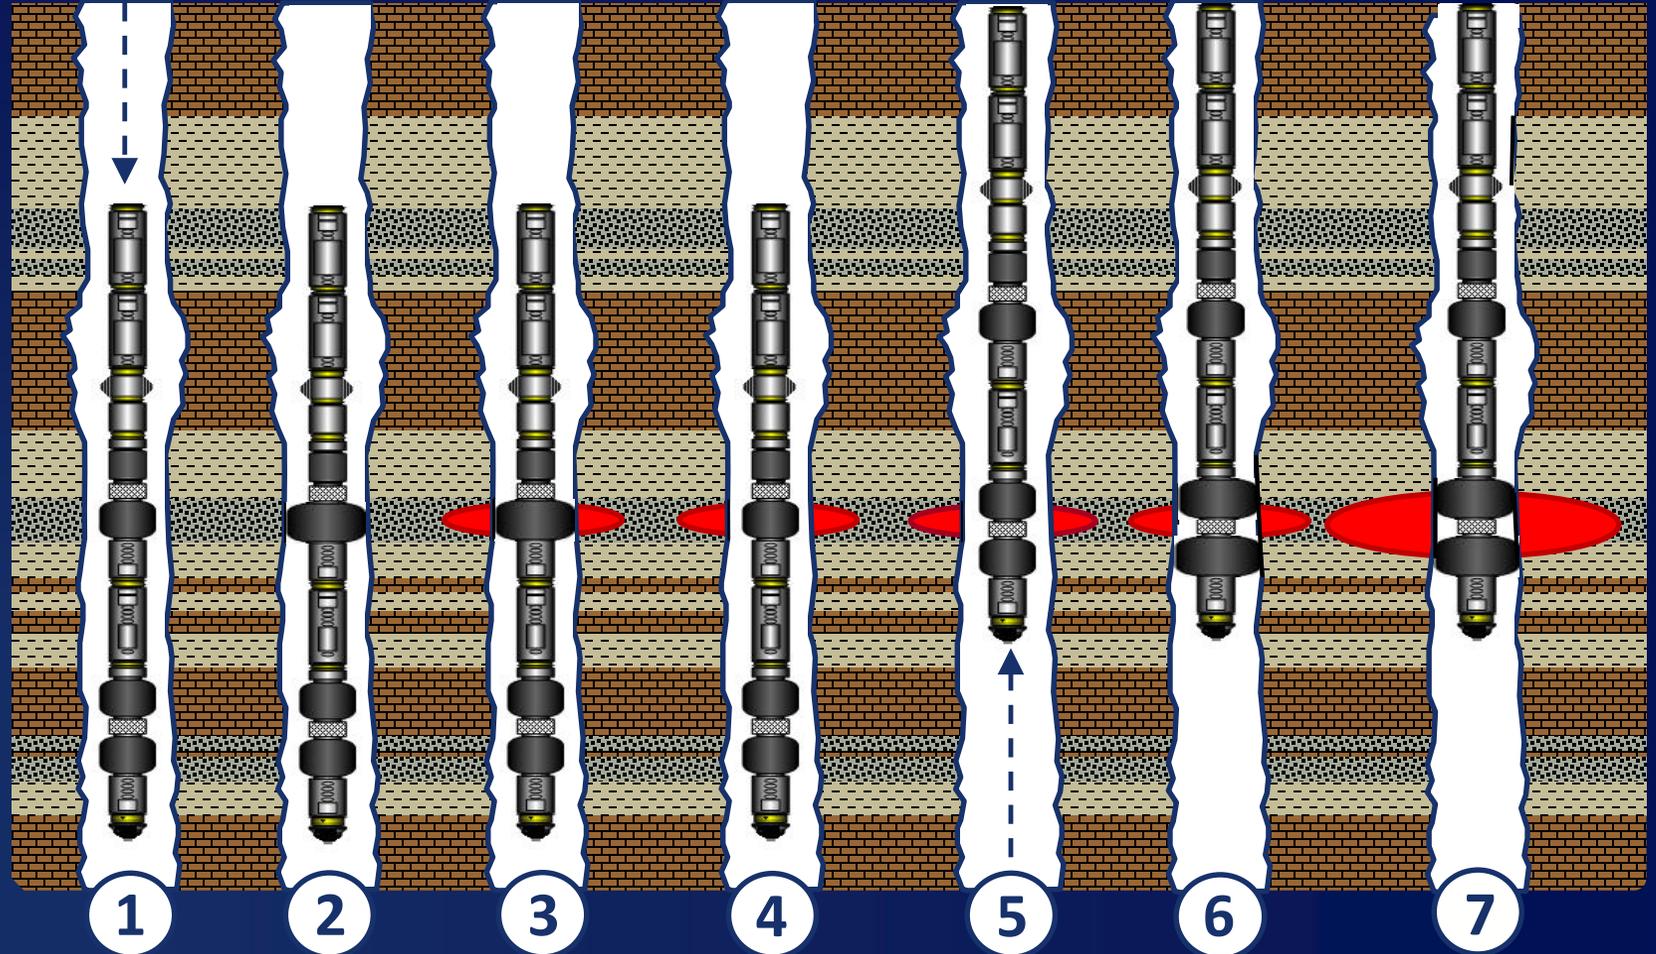

New Case-hole Straddle Packer

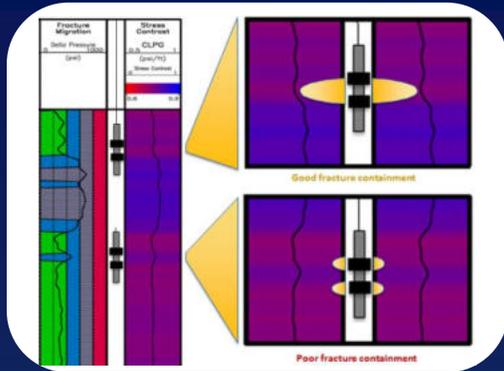

Sleeve Fracturing Alternative Testing

1. Position single packer at testing interval
2. Inflate single packer
3. Sleeve Fracture
4. Deflate single packer
5. Position straddle Packer at interval
6. Inflate straddle packer
7. Perform straddle packer microfrac testing

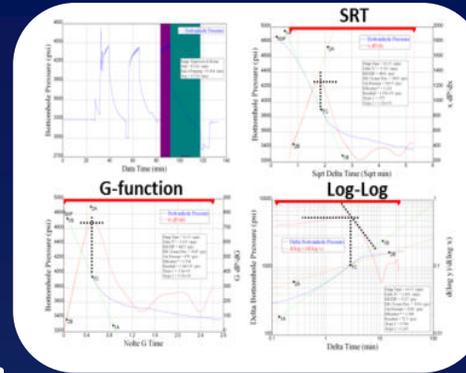

Enhanced Microfrac Testing Workflow

PRE-JOB ASSESSMENT

REAL TIME MONITORING

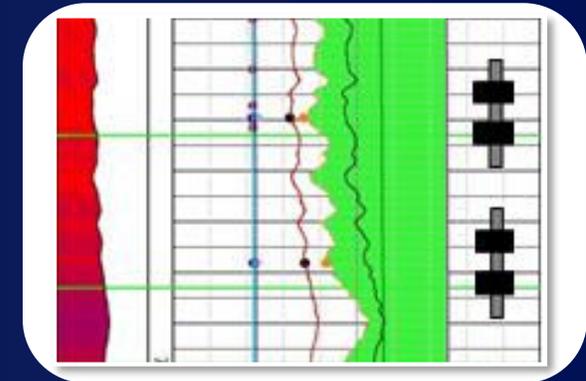

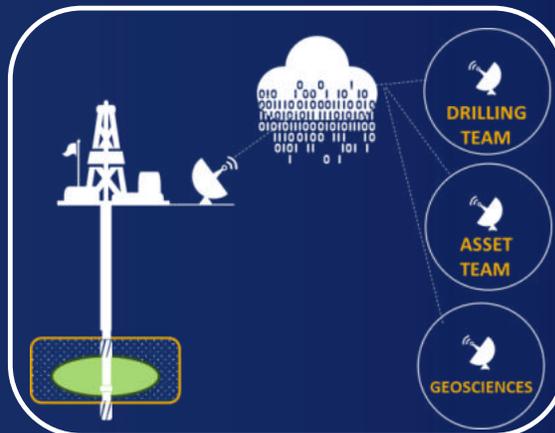

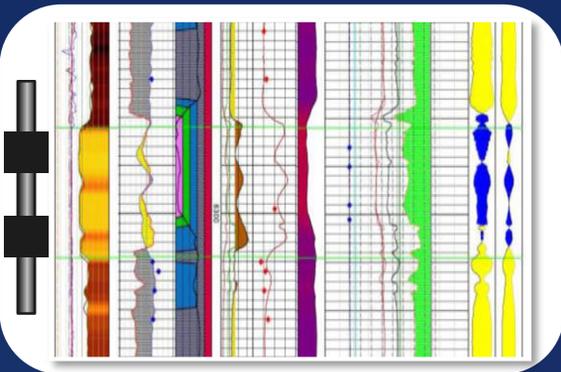

TECTONIC STRAIN CALIBRATION

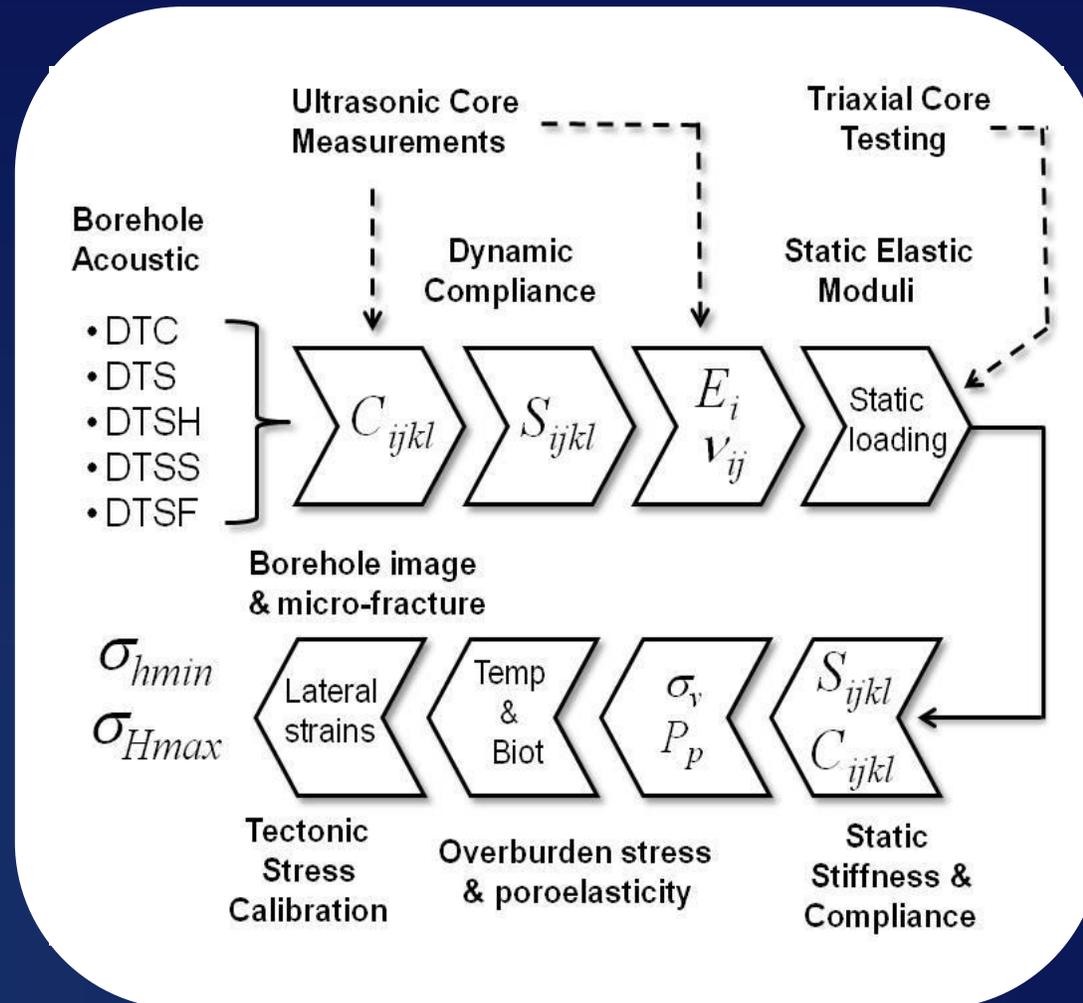

INTERVAL SELECTION

POST-ACQUISITION ANALYSIS

Prejob Microfrac Assessment

- Estimation of formation mechanical properties
- Estimation of stresses
 - Overburden stress and pore pressure profile
 - Minimum and maximum horizontal stresses
- Prediction of formation breakdown pressure
- Maximum tool pressure capability

MICROFRAC TESTING

Prejob Assessment

Interval Selection

Real Time Monitoring

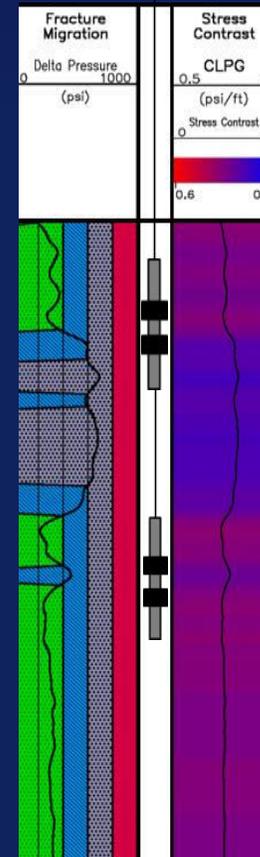

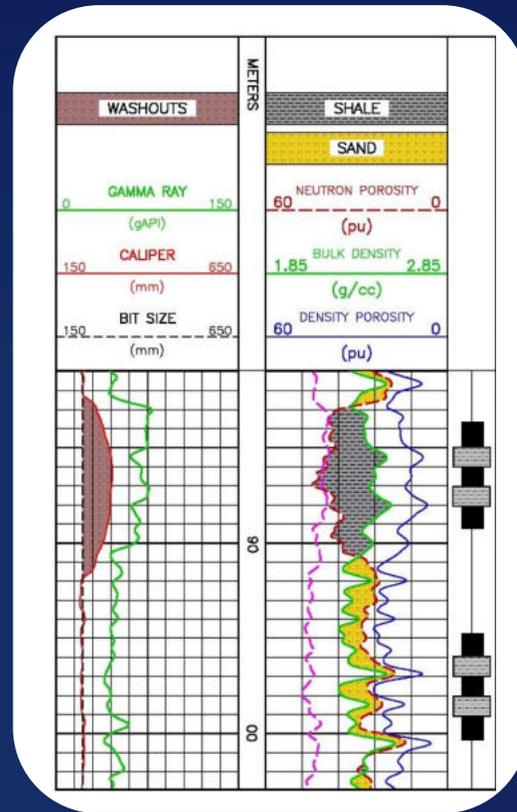

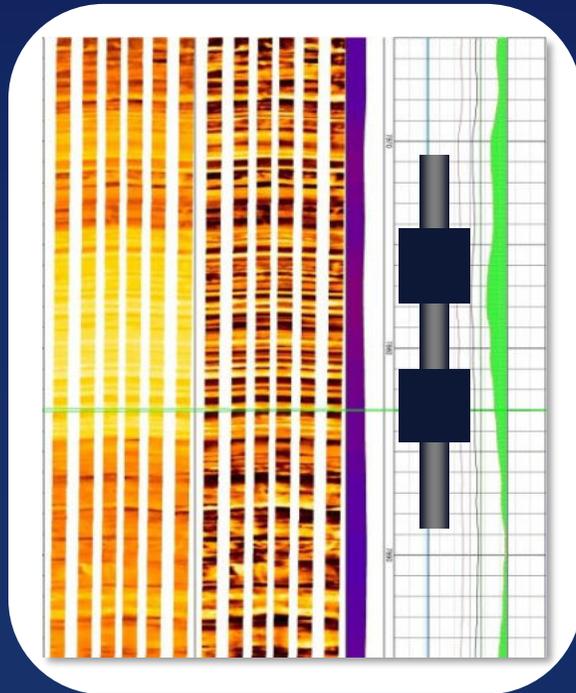

Post Acquisition Interpretation

Hstress Tectonic Calibration

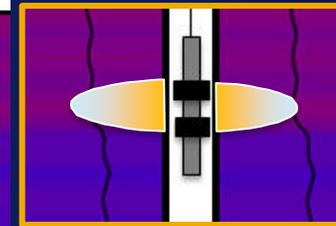

FINAL STRESS MODEL

Real-Time Interval Selection

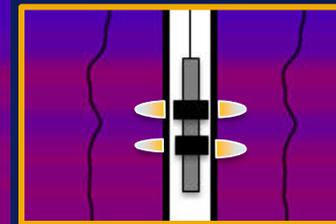

- Rush borehole acoustic processing (DTc and DTs)
- Borehole Image assessment (Breakouts / Fractures)
- Hole caliper quality (Washouts)
- Stress contrast

GOOD FRACTURE CONTAINMENT

POOR FRACTURE CONTAINMENT

MICROFRAC TESTING

Prejob Assessment

Interval Selection

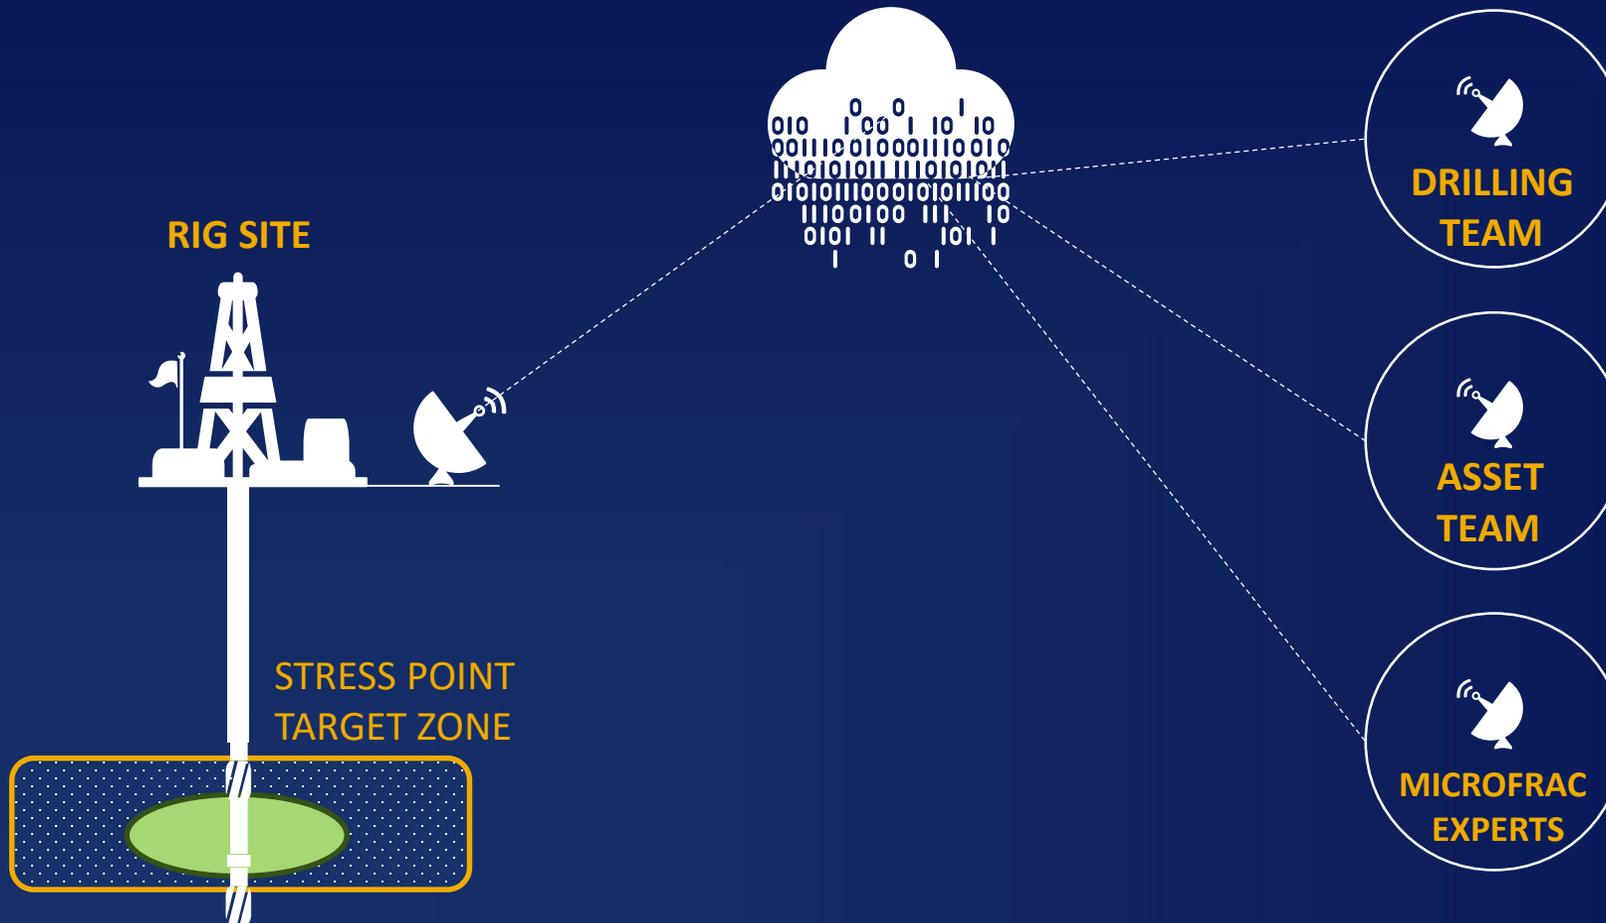

Real Time Monitoring

Post Acquisition Interpretation

Hstress Tectonic Calibration

FINAL STRESS MODEL

MicroFrac Real-Time Data Monitoring

MICROFRAC TEST

Prejob Assessment

Interval Selection

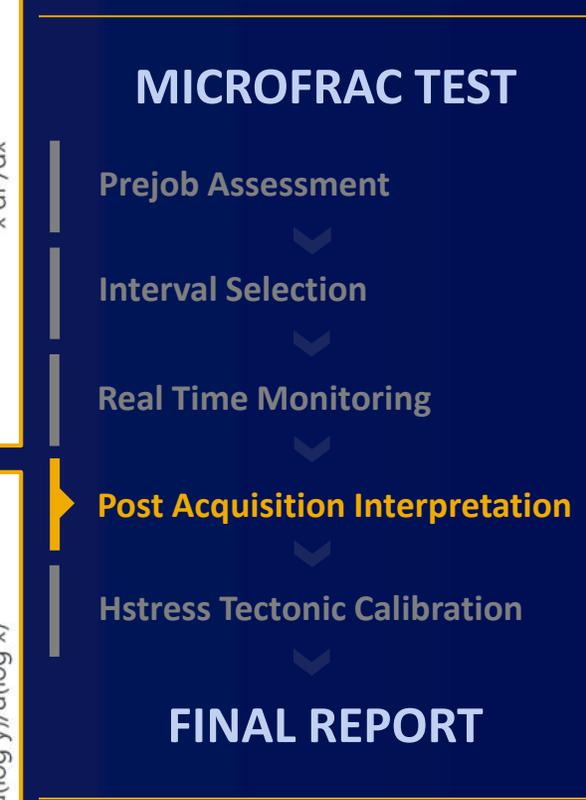

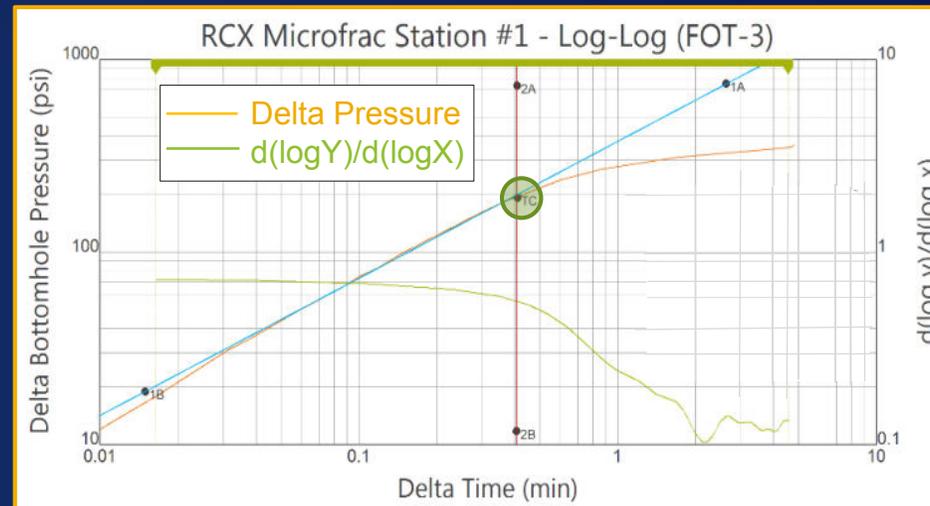

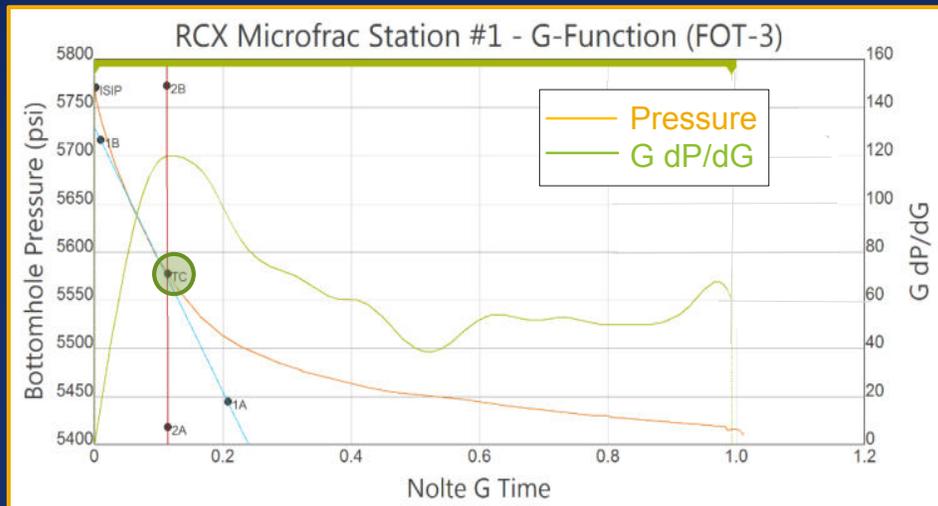

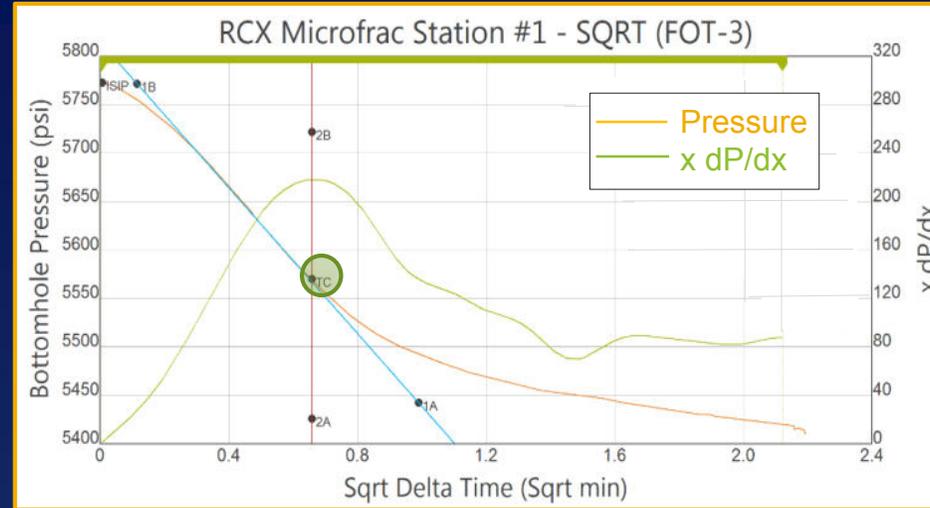

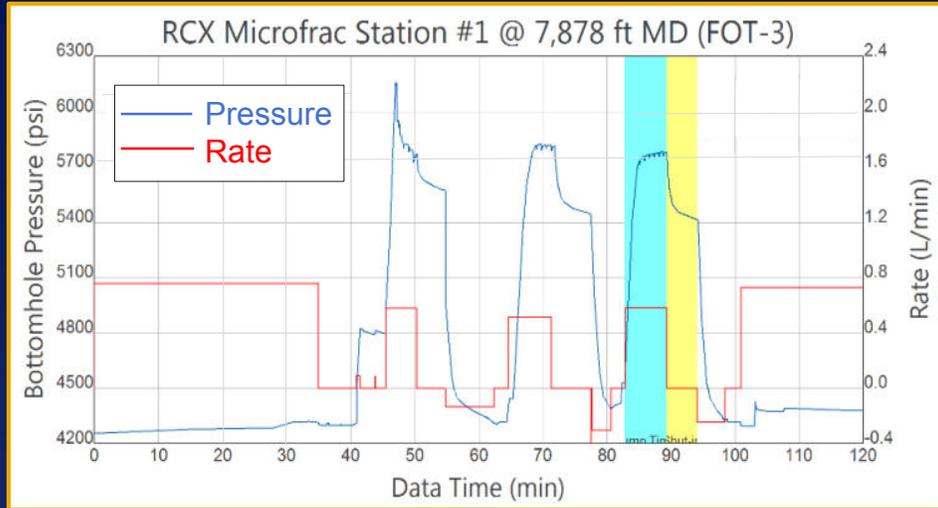

Real Time Monitoring

Post Acquisition Interpretation

Hstress Tectonic Calibration

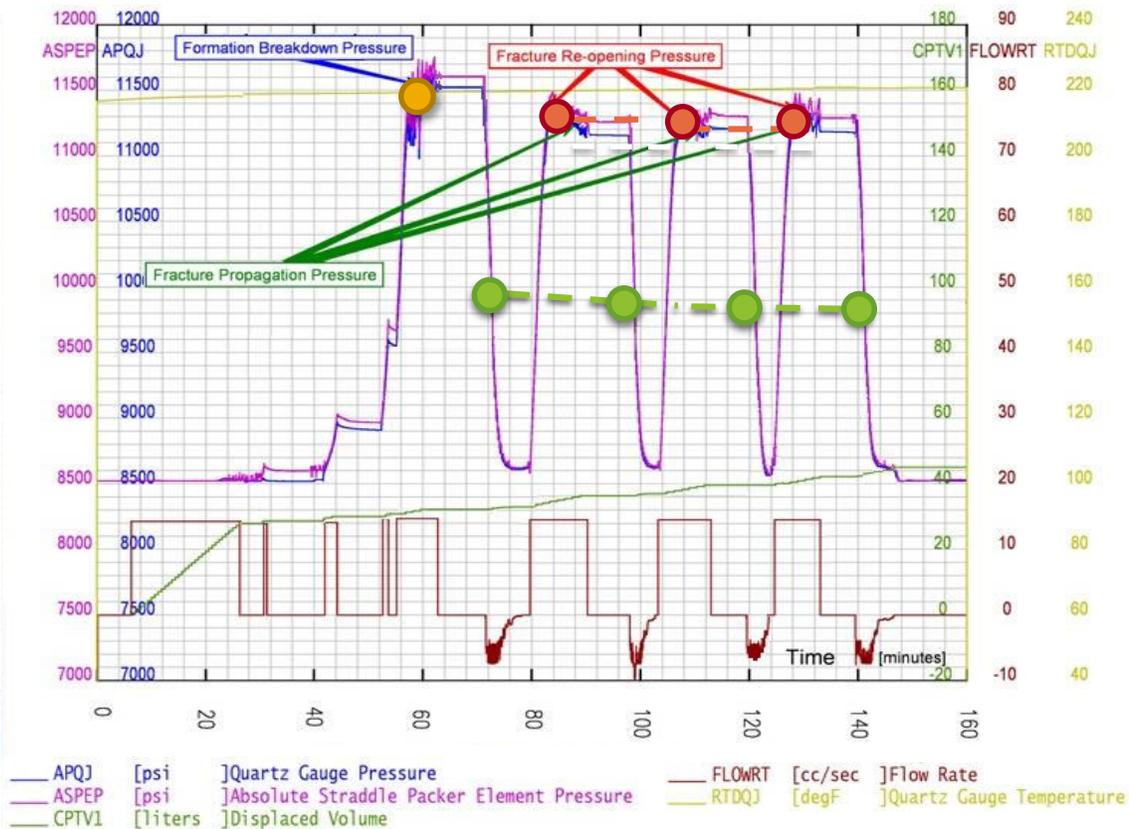

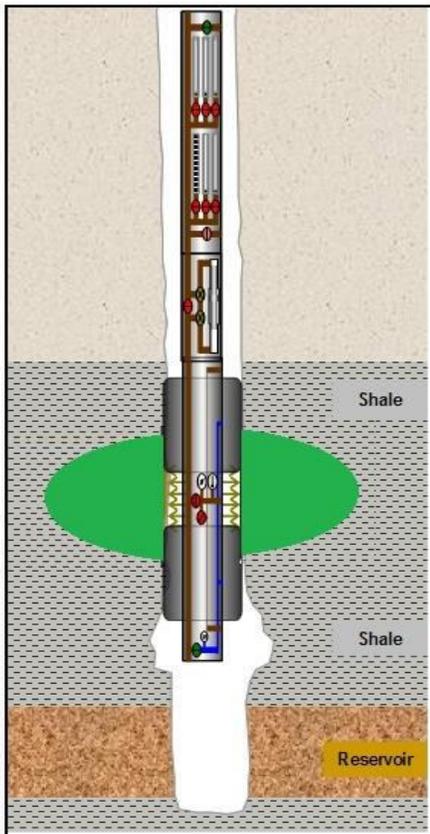

FINAL REPORT

Post Acquisition Interpretation (Reservoir)

Post Acquisition Interpretation (Shale)

Fracture Closure Analysis Using Controlled Flow-back

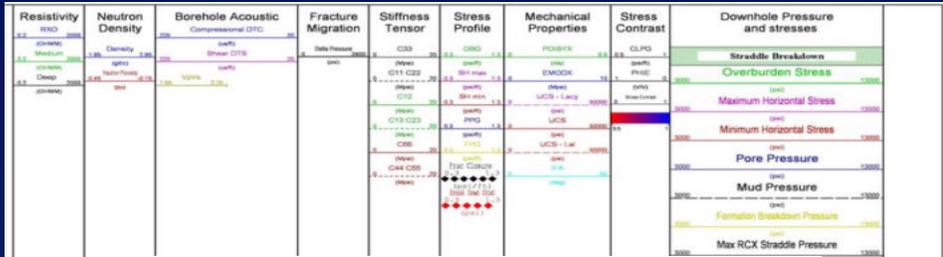

FORMATION BREAKDOWN PRESSURE FRACTURE REOPENING & PROPAGATION PRESSURE FRACTURE CLOSURE PRESSURE

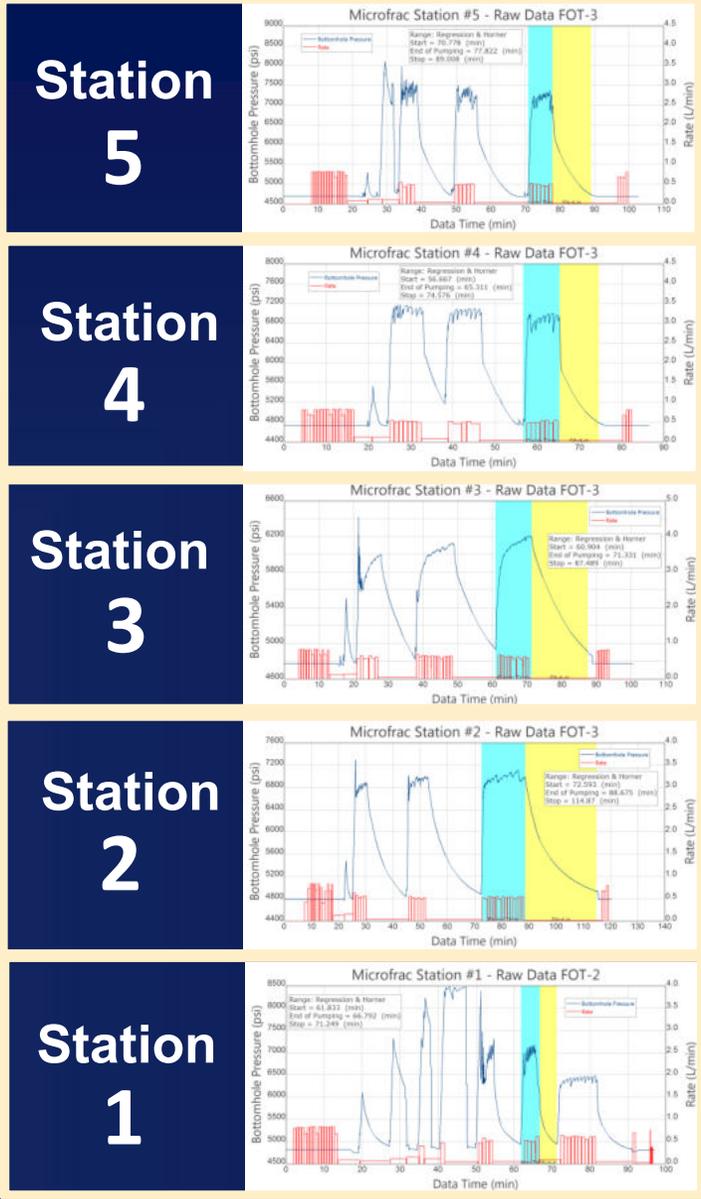

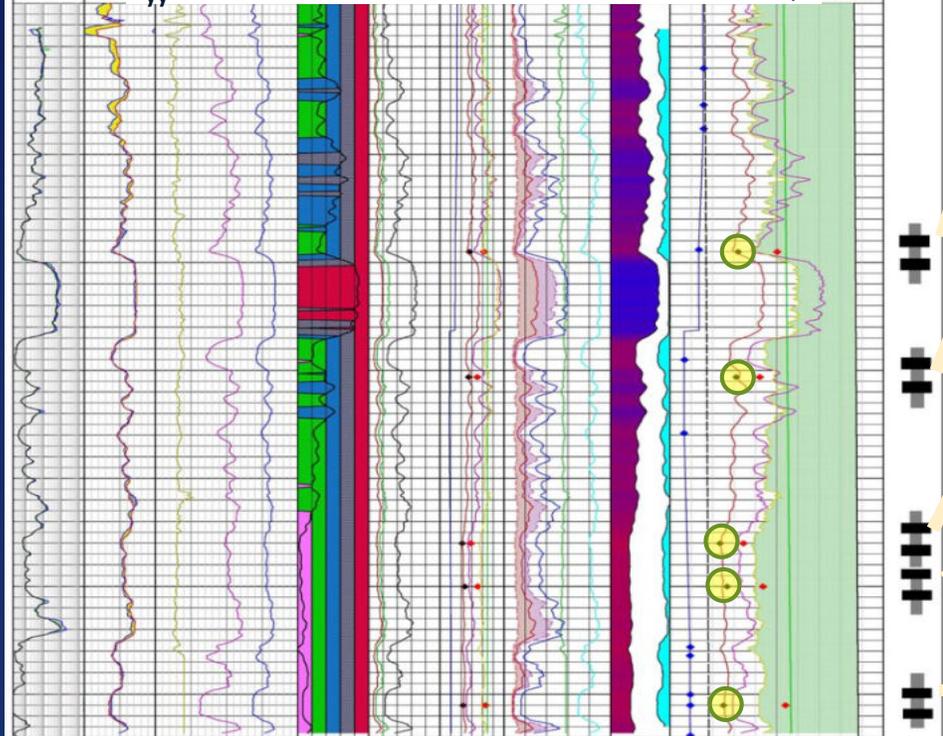

MICROFRAC TEST

- Prejob Assessment
- Interval Selection
- Real Time Monitoring
- Post Acquisition Interpretation**
- Hstress Tectonic Calibration
- FINAL REPORT

Horizontal Tectonic Strain Calibration

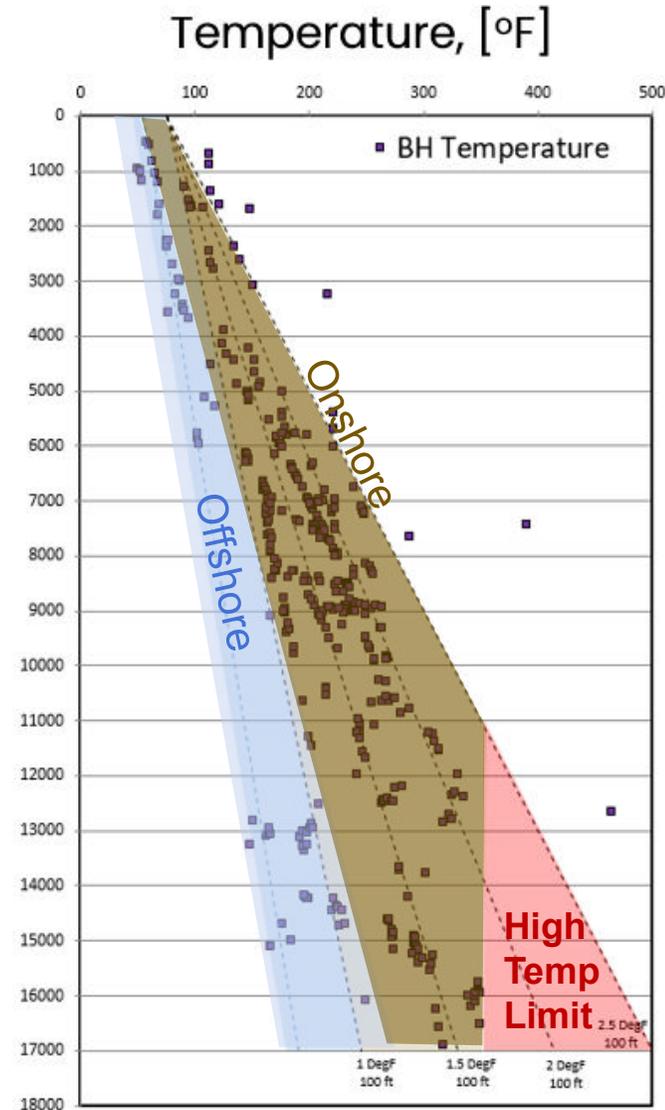

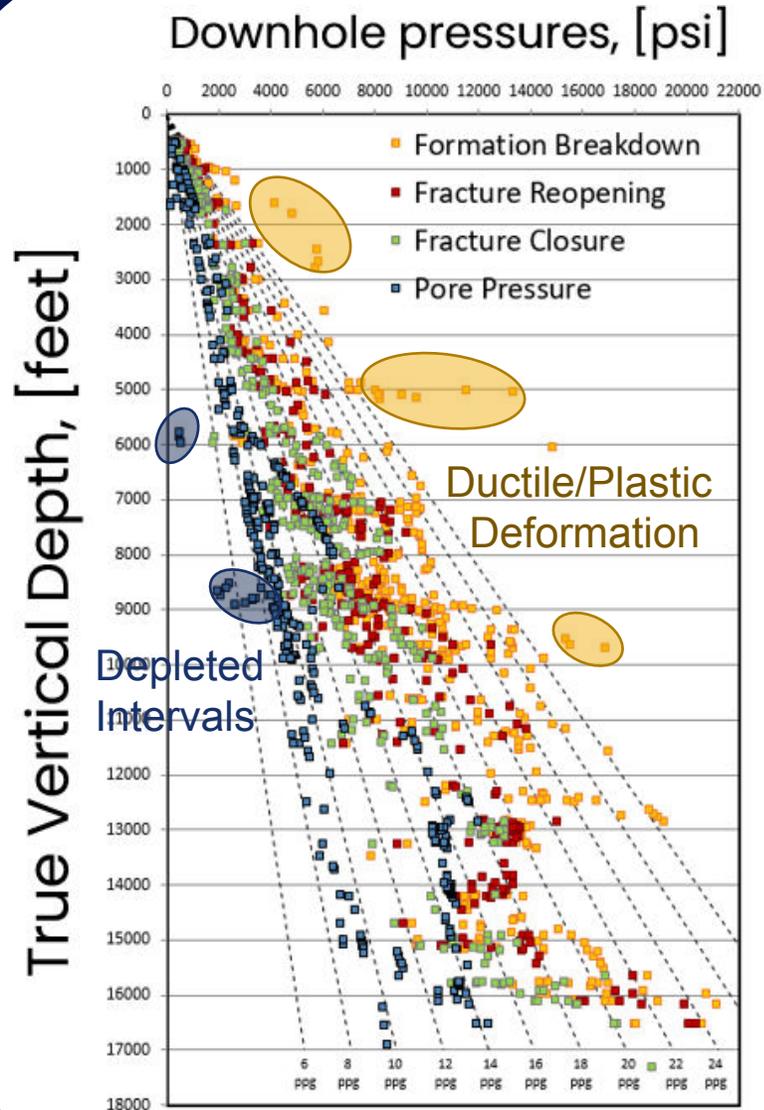

$e_{xx} = 0.01 - 0.1$ mStrain (Min. tectonic strain) ●●●●●
 $e_{yy} = 0.3 - 0.7$ mStrain (Max. tectonic strain) ●●●●●

MICROFRAC TEST

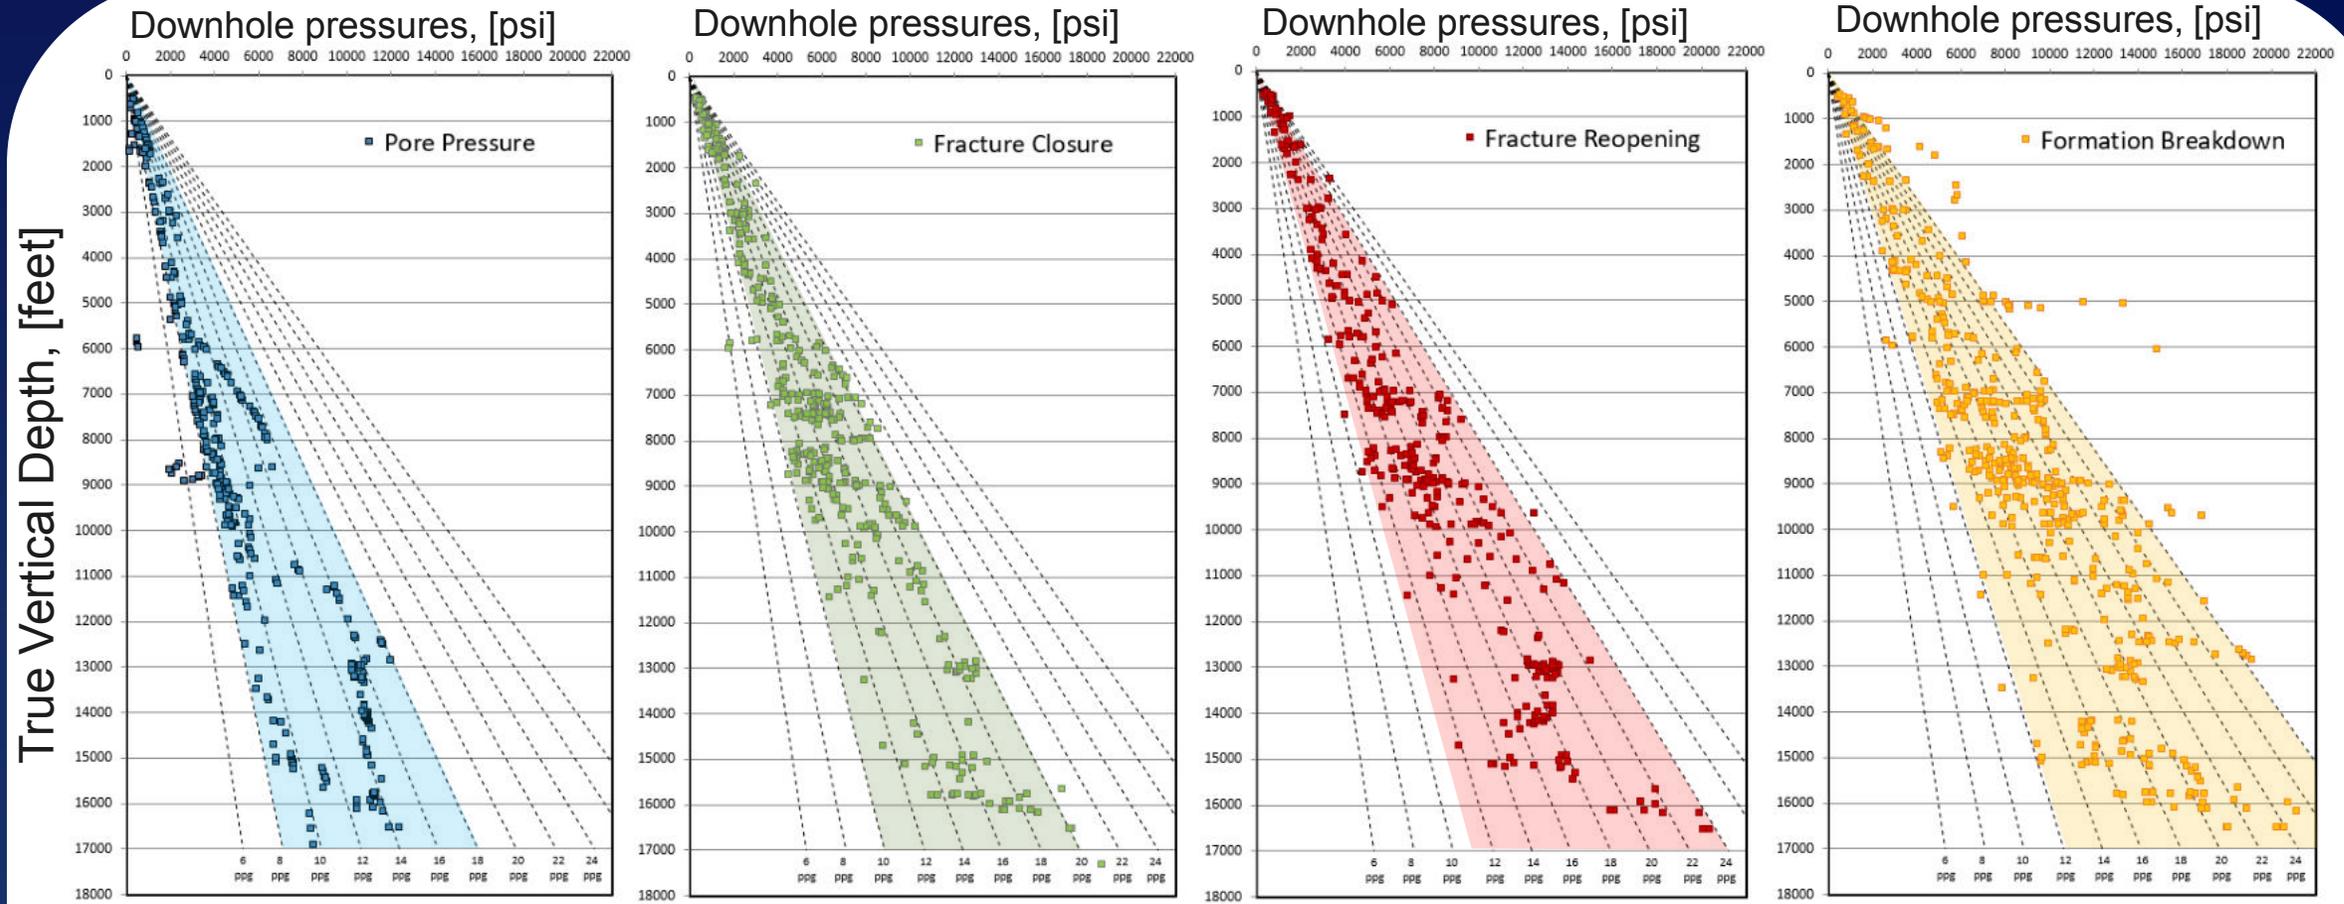

- Prejob Assessment
- Interval Selection
- Real Time Monitoring
- Post Acquisition Interpretation
- Hstress Tectonic Calibration**

Take Away Summary

- Subsurface stresses cannot be measured directly by any logging technology at in-situ conditions
- Only small volume & low rate Straddle Packer Microfrac Testing can accurately calibrate tectonic stress profiles by performing multiple stress measurements at different lithologies
- Calibrated stress profiles provide accurate prediction of:
 - Hydraulic fracturing propagation and containment
 - Reservoir stress-path compaction and solid production
 - Wellbore stability during drilling campaigns
 - Cap-rock integrity during injection
